

Enagás wins the contract for a Compression Station in Mexico

The consortium consisting of Enagás (50%) and the Mexican company Fermaca (50%) has won the tender process run by the Mexican Federal Electricity Committee (CFE) to provide the natural gas compression service through the construction, operation and maintenance, in the role of owner, of the Soto La Marina Compression Station, in the State of Tamaulipas (Mexico), for a period of at least 20 years.

This infrastructure will provide a natural gas compression capacity of up to 19 bcm and to increase its transport capacity will interconnect with the San Fernando-Cempoala pipeline owned by the company Petróleos Mexicanos (Pemex).

The investment planned for this project is around \$90 mn. The plan is to finance the project using Project Finance.

The Soto la Marina Compression Station is in keeping with Enagás' strategy for international growth in stable countries such as Mexico, investing in core business activities while maintaining an optimal level of profitability and establishing agreements with partners who provide experience in the local market.

Presence in Mexico

Enagás already has a 40% share in the Altamira regasification plant, located in the Gulf of Mexico, and forms part of the consortium that won the contract to develop a 160 km pipeline running from the State to Tlaxcala to that of Morelos, in the central area of the country.
