OTHER RELEVANT INFORMATION

Almirall licenses an anti-IL-21 monoclonal antibody from Novo Nordisk to develop it as a first-in-class agent in dermatology

In accordance with Securities Markets Law, Almirall S.A. (“Almirall”) announces the following:

- Almirall obtains exclusive global rights to develop and commercialize NN-8828 for use in several fields, including immune inflammatory dermatological diseases
- NN-8828 is an IL-21 blocker which inhibits the pathophysiological functions induced by this cytokine in several immune-modulated diseases

Almirall has entered into an exclusive license agreement with Novo Nordisk for rights to the IL-21 blocking monoclonal antibody NN-8828. Under the agreement, Almirall obtains global rights to develop and commercialize this monoclonal antibody in certain fields, including immune inflammatory dermatological diseases.

Almirall will accelerate the development of the asset to address key dermatological diseases taking responsibility for the global development and future commercialization in these indications. Novo Nordisk will receive an upfront payment as well as additional development and commercial milestone payments and tiered royalties based upon future global sales.

NN-8828 is a first-in-class in dermatology, high affinity monoclonal antibody that targets the cytokine IL-21 and has been developed by Novo Nordisk up to Phase II in non-dermatological indications. NN-8828 has the potential to block the activation of the downstream signaling pathways of IL-21 and inhibit the pathophysiological functions induced by this cytokine in several immune cells. This differentiated mechanism makes NN-8828 a promising option for the treatment of inflammatory and autoimmune skin disorders.

Sincerely,
